UV-LED based Advanced Oxidation Process

Photolytic ozonation as a promising technology for
disinfection and CEC removal?

Philipp Sperle

4th June 2025

Basics in advanced oxidation processes (AOPs)

PRISTINE

Generation of highly reactive species /radicals ($\text{OH}\cdot$) oxidizing pollutants

H_2O_2 -UV

- ⊕ Well suited for clean water, UV-transmittance > 90% (high quantum yield) and for conventional UV lamps (wavelength around 254 nm)
- ⊕ Provides disinfection, no bromate
- ⊕ Low footprint (hydraulic retention time (HRT) ~ 1 min)
 - Higher energy usage because of higher UV-dose required
 - Losses efficiency for dirtier water (low molar extinction coefficient) and higher wavelengths as UV-LEDs (around 270 nm)

H_2O_2 - O_3

- ⊕ No energy use by UV light, high radical efficiency
- Typically not considered for disinfection
- Higher foot print (HRT ~ 3-5 min) depending on the water matrix

O_3 -UV

Photolytic ozonation

- ⊕ Requires less UV light
- ⊕ Better suited for dirtier water (high molar extinction coefficient and radicals by O_3 / H_2O_2 - O_3 reactions) and higher wavelengths (using UV-LEDs)
- ⊕ Provides disinfection?
- ⊕ Low footprint, higher reaction speed (HRT can be reduced to ~ 1 min)
 - Complex process, energy for O_3 , radical yield might be lower than for H_2O_2 - O_3

The PRISTINE UV-LED based Advanced Oxidation Skid

PRISTINE

Experiments tap water + humic acids (UV transmittance ~ 87%, pH = 7.4-7.7) + Br⁻ + pCBA as probe compound:

- **High boost of pCBA removal when adding UV irradiation (more than double)**
- **> 3 times higher pCBA removal by O₃-UV with 5 LED Arrays than for H₂O₂-UV AOP with 12 LED arrays**

→ Reaction 15 min Ozone / 1 min O₃-UV/ 1 min UV/H₂O₂

#EUGREENWEEK

On going tasks and outlook

PRISTINE

- Tests needed in real water matrixes; benefits of O_3 -UV seem to depend on water matrix
- AOP pilot experiments with NF permeate currently ongoing, but removal of O_3 on its own too large to quantify effects (perform spiking?)
- O_3 -UV especially promising in water with low O_3 decay and radical yield; performance boost to sole O_3
- O_3 -UV might outperform H_2O_2 -UV especially for dirtier waters (e.g. interesting when using NF feed) and higher wavelengths (UV-LEDs), but costs for O_3 generation must be accounted for (currently ongoing)
- O_3 - H_2O_2 shows better removal, but O_3 -UV offers low physical footprint and disinfection
- O_3 -UV might be a great option for retrofitting in scenarios where CEC removal and disinfection are required (typical UV doses for disinfection)
